1. Introduction

1.1 Orientation in the Instructions for Use

- This user guide has been designed so that the users can easily and quickly find the information necessary to manage the operation and maintenance of heating equipment.
- The users should read the entire user guide with utmost attention and make sure they have perfectly understood all information contained in it.
- The user guide also serves for subsequent reference when needed. For this reason this user guide must be always available to the person operating the equipment.
- Searching this user guide is facilitated by the general table of contents, which allows immediately finding a specific location, and also by table of contents at the head of each section.
- In addition, next to some paragraphs, there are signs inserted to emphasize the importance of the information contained in those paragraphs, **which should be read with special attention!**

1.2 Explanation of symbols used in the Instructions for Use

Warning - Danger of electrical injury - refers to parts, where there is a danger of electrical injury. Read especially carefully.

Warning - Rotating parts - refers to parts, where there is a danger from rotating parts.

Warning – Risk of injury - refers to parts, where there is a risk of injury while touching the equipment in operation. Read especially carefully.

Warning - Important - refers to parts, where danger might occur, or to parts otherwise important. Read especially carefully.

Do not wash with pressurized water – it is forbidden to wash a part so indicated with pressurized water for risk of damaging the equipment.

Forbidden handling procedures – refers to parts, where there is a risk of damaging the equipment by handling it in a forbidden way.

2. Common provisions

2.1 Transport and equipment

2.1.1 Transport

The customer is obliged to inspect the completeness and integrity of the package in which the appliance is transported. Any damage during transport should be addressed with the respective carrier. After delivery, the appliance must be moved to the final place of installation in its original package, if possible.

2.1.2 Unpacking

When the appliance is transported to the place of installation, remove all packages.

Remove all protective films from the outside and inside of the appliance. The consumer is obliged to dispose of all packages in accordance with the applicable regulations in the country of installation!

2.1.3 Dismounting and disposal

After its life cycle expires, the appliance must be disposed of in accordance with the applicable regulations in the specific country. The appliance contains:

- | | |
|---|----------------------------------|
| · stainless steel | · Moplen |
| · ferrous metals - aluminium,
copper | · Nylon |
| · glass | · polyethylene |
| · PVC | · lubricating oil |
| · methacrylate (PMMA) | · cooling gas |
| · polystyrene (PS) | · polyurethane |
| · ABS | · electric motors |
| | · supply cable, wiring materials |

2.2 Test reports, guarantee conditions

2.2.1 Testing

Each appliance is factory tested in accordance with the applicable laws, technical standards and government regulations. A test report on the tests performed is issued for each appliance and kept in the factory. The appliance is sent to the customer in a ready-to-use condition. This does not apply to appliances built in complex dispensing lines and installed on-site at the customer.

2.2.2 Warranty

Thank you for using our products. Our company will adhere to the relevant provisions of our "Terms and Conditions" and provide you with appropriate services upon submission of the invoice. **We offer a 12-month warranty from the date of purchase (invoice issue date).**

During the warranty period, our company is responsible for free replacement parts and related services if there is a device malfunction or quality issue during proper operation.

The free services do not cover the following damages:

- Failure to provide an invoice or alteration of invoice details.
- Damage caused during transportation (it is necessary to inspect the condition of the goods upon receipt from the carrier), installation, or improper connection and handling.
- Damage to components caused by failure to provide power and voltage according to the specifications in the technical data.
- Damage caused by disassembly of the products, modification, or alteration of mechanical and electrical structures without permission.
- Damage caused by improper operation, cleaning, or maintenance.

- Non-human-caused damages such as damage caused by abnormal voltage, fire, building collapse, lightning, floods, and other natural disasters, as well as damage caused by rats and other pests.
- Failure to follow the operating instructions during use.
- Wearable and consumable parts.

If the following conditions are not met, the complaint will not be considered:

How to proceed with a complaint for the fastest resolution:

- **Product identification** – by submitting the order, invoice, or inspection label.
- **Description of the defect** – describe as thoroughly as possible why the product is being claimed.
- **Attach photos or video** (used to assess the claim resolution and possibly propose repairs and ensure spare parts needed for the repair).
- **Customer's request** for claim resolution – repair (service) / return, etc.
- **Contact person** and address where the product is located.

2.3 Safety

2.3.1 Safety - electrical current

The appliance is fitted from the factory with a connecting cable for power supply, ending with an inseparable plug. The plug can be inserted in a socket with the voltage system of 1, N, PE ~ 230 V, 50 Hz (EURO socket with a protective pin, SHUKO socket with safety contacts)

The plug may only be replaced by a person with qualifications in electrical engineering; the wiring of the applicable may only be interfered with by a person with qualifications in electrical engineering, subject to agreement with the factory! Interference with the wiring is vitally dangerous and may cause electric shock!

It is prohibited to touch the supply plug, the control panel and other electrical parts with a wet or damp hand and to wash them with pressure water. There is a risk of electric shock!

Prior to any maintenance, it is necessary to remove the plug of the supply cable from the socket and make sure that the appliance is not powered (e.g. by switching on the main switch and checking whether the appliance responds). If the appliance is hardwired to an electric circuit, it is necessary to switch off the respective circuit breaker, test if the appliance is disconnected and secure the circuit breaker, e.g. with a tag containing the text "Work on Equipment".

2.3.2 Safety - mechanical parts

When operating the appliance, it is necessary to exercise increased caution, especially in case of the following work:

- When opening and closing the doors of steam tables, closed tubs, cases; the doors are placed on roller hinges and are easily movable, it is necessary to pay increased attention when closing the doors, there is a risk of trapping a limb.

- **When operating a heating appliance with fans: do not touch and do not insert objects through fan covers. The rotating fan blades may cause an injury.**

2.3.3 Safety – leakages

The medium used for heating tubs is drinking water. It is necessary to check drain valves as well as the downstream discharge pipes to avoid waste water leakage and subsequent damage to other equipment.

2.3.4 Safety - heat effects

When operating heating appliances, a part of the appliance is heated to **a high temperature** and **there is a risk of burning**.

2.3.5 Correct use of the appliance

- The appliance is designed for normal use by an adult. It is not designed for rough handling and operation by children! Appliance operators must be thoroughly and demonstrably trained and keep these Instructions for Use at hand.
- The appliance must be operated in accordance with the Instructions for Use. The appliance may only be used for its intended purpose.
- Do not place the heating appliance next to an appliance that could be damaged due to the generated thermal energy.
- Before the appliance is filled with goods, pre-heat it to the selected temperature.
- Do not put any food perishable due to high temperature in the heated area.
- Keep the heated area clean.
- Do not leave the door to the heated area open - this would reduce the appliance's performance and life cycle.
- Regularly check the appliance and perform maintenance work as per these Instructions for Use.

HEATING TUBS

The appliance is capable of working faultlessly under the following conditions:

- Altitude up to 1,000 m above sea level.
- Ambient temperature at the appliance between 15°C and 25°C.
- Maximum relative humidity 60%.
- The appliance is not placed close to any other appliance that would be harmed by water steam (cooling cases, open cooling tubs, etc.)

3. Technical parameters

3.1.1 Technical description of heating tubs

Heating tubs are made of a rigid, self-supporting stainless steel structure. The heating area is made of a stainless steel tub insulated with heat-resistant insulation. The tub is seated in a stainless steel structure enclosed with stainless steel sheet. The water tub in the boiler is heated by heaters placed in an insulated housing under the tub.

These heated tubs are used to keep meals placed in food containers warm. These tubs must not be used for other purposes without an express approval of or, if applicable, structural changes made by Gastro Production s.r.o. These boilers are designed to provide the best results if all the instructions contained in this manual are met. To be able to use the heated tubs optimally and keep them in an excellent condition, we recommend performing regular maintenance work. Tub operators must be acquainted with instructions regarding operation, maintenance and safety, contained in this manual.

Automatic – filling the tub by turning on the thermostat and water is automatically filled to the level sensor and the water is maintained automatically. Semi-manual – filling the tub by holding down the button. Manual - filling the tub with a bucket or hose. Draining - the switch activates the electric valve and opens the drain pipe.

3.1.2 Technical description of dry heated tub

The tub with glass ceramic plate and a heating element below it. It heats the air. Usable without water connection and drain pipe. This tub has only one size type, so these tubs must be next to each other. These tubs are designed to provide the best results if all the instructions contained in this manual are met. To be able to use the tubs optimally and keep them in an excellent condition, we recommend performing regular maintenance work.

3.2 Dimensions and technical specification

Dimensions of the equipment and technical specification can be found according to the type of equipment at www.gastro.cz.

3.3 Type Labels

Illustrative example.

	GASTRO PRODUCTION s.r.o. Zemědělská 500, 373 81 Kamenný Újezd	CZ
		
SN: 2025_OBP -.....		Type:
<hr/>		
Input P: kW	V1-000000-0000	
Current load Iv: A	Climatic class "3"	
		OBP-.....
Voltage system:		

4. Installation and operation

4.1 Seating

Always proceed carefully and slowly when handling the equipment to avoid damage or injury! Consider the weight of the equipment. Ideally, four people are required to handle the equipment. After unpacking, place the equipment in a horizontal position at the designated location.

Place the unpacked equipment in a horizontal position at the operation site using leveling feet or a stainless steel plate. Place it in the pre-prepared opening for installation if the goods were delivered separately and not as a set with the top panel, etc.

4.2 Electrical connection

The appliance is fitted from the factory with a connecting cable for power supply, ending with an inseparable plug. The plug can be inserted in a socket with the voltage system of 1, N, PE ~ 230 V, 50 Hz (EURO socket with a protective pin, SHUKO socket with safety contacts). Insert the supply cable plug in the socket. Make sure the plug is accessible to operators. The supply cable must be placed visibly, without any sharp bends. The supply cable must not be placed on sharp edges of steel and other parts.

4.3 Appliance actuation

After positioning the equipment, wait at least 30 minutes before turning it on. During the winter months, wait 12 hours at room temperature. After seating, close the drain valve and fill the tub with water. The volume of water depends on the type. Markings on the rocker switch - "I" (close) or "II" (open).

Switch the appliance on by turning the control knob clockwise; the green voltage indicator lamp lights up. Turn the control knob further, the red heating indicator lamp lights up. Select the required tub temperature by turning the knob further. When the red indicator lamp goes off, the tub is heated to the selected temperature.

Heating tubs: Automatic – filling the tub by turning on the thermostat and water is automatically filled to the level sensor and the water is maintained automatically. **Semi-manual** – filling the tub by holding down the button. **Manual** - filling the tub with a bucket or hose. Standard volume is about 5 l per food container 1GN. You can add warm water to accelerate first heating.

Dry heated tub: Be careful and do not touch the glass-ceramic surface, as it is currently heating up after setting up the tub and turning on the tub.

CAUTION! When heating and operating, the tub with food containers must be covered because at temperatures above 70°C, all energy is converted into steam. It is complicated to keep the high temperature of the appliance, there is excessive steam leaking from the tub and the life cycle of the appliance is reduced.

4.4 Filling the appliance with goods

When the set temperature of the heating tub is reached, you can fill the food containers with goods and put them in the tub.

Follow the principles of proper use of the appliance.

- **Make sure the tub is fully covered during operation.**

- **Heating tubs:** During operation, check water surface and refill to operating volume. Appliances with automatic water surface monitoring watch the surface and refill water automatically.

4.5 Operation of the appliance

- **Keep the heating area clean.**
- **Do not leave the tub uncovered – it reduces the performance and life cycle of the appliance.**
- **Regularly check the appliance and perform maintenance work as per section 6 of these Instructions for Use.**

5. Control knob for heating equipments

To control the heating equipments, the rotary knob on the thermostat is used. Using this knob, you can adjust the desired temperature for the respective device according to its markings. Some knobs feature a visual indicator, such as an expanding section at one end, to signify the addition of heat. Additionally, there are knobs with labeled temperatures for precise temperature adjustments.

6. Maintenance

6.1 General safety measures

- Study these Instructions for Use thoroughly before the commencement of maintenance work. Comply with the principles set forth in section **2.3 Safety**.

- Prior to any maintenance, it is necessary to remove the plug of the supply cable from the socket and make sure that the appliance is not powered (e.g. by switching on the main switch and checking whether the appliance responds).
- If the appliance is hardwired to an electric circuit, it is necessary to switch off the respective circuit breaker, test if the appliance is disconnected and secure the circuit breaker, e.g. with a tag containing the text "Work on Equipment".
- Proceed with caution and without hurry during maintenance work.

- Pressure water must not be used for washing the appliance, there is a risk of damage to the controls and electronic parts and the subsequent damage to the entire appliance!!!
- For the purposes of cleaning, use regular kitchen detergents approved for use with food!!!

6.2 Regular maintenance

6.2.1 Inspections

6.2.1.1 Tub

- Check visually whether the tub is not damaged (deformed, perforated, etc.). If the tub is damaged, it is necessary to contact a service organization, there is a risk of destruction of heater due to water ingress.
- Wash the tub and wipe dry with a piece of cloth.

6.2.1.2 Drain valve (Heating tubs)

- Check if the valve is passable, e.g. using a flashlight; passage must not be restricted. Check if the valve closes.

6.2.1.3 Filling nozzle (Heating tubs)

- Check visually whether the holes of the filling nozzle are not clogged. While filling during operation, check if water is flowing through all nozzle holes. It is necessary to clean any clogged nozzle holes, e.g. using a hard steel wire.

6.2.1.4 Drain pipes (Heating tubs)

- Check whether waste water does not leak through the joints of drain pipes. Defective joints must be replaced with new ones.

6.2.1.5 Controls

- Check the control knob of the mechanical thermostat for cracks. Replace a defective knob with a new one.
- Check indicator lamps for damage. Replace defective lamps with new ones.
- Check the top cover of the electronic control unit for damage. Replace a defective knob with a new one.

6.2.1.6 Glass-ceramic plate (Dry heated tub)

- Always be careful not to touch the hot glass-ceramic plate during and after use. Allow the surface to cool down before cleaning or touching and then wipe it with a soft damp cloth.
- Avoid using abrasive pads or harsh cleaning agents to prevent scratching.
- Clean up spills immediately to avoid staining or damage to the surface. Allow the surface to cool down before cleaning. Use a soft cloth or paper towel to wipe away spills gently.
- Scratches: Avoid sliding or dragging heavy or rough objects on the surface, as this can cause scratches.

6.2.2 Maintenance

6.2.2.1 Daily maintenance

- During maintenance work we comply with the principles set forth in section **6.1 General safety measures**.
- When daily operations are over, switch off the appliance. Remove food containers from the appliance, drain the tub, wash and wipe it dry. Leave the space open to avoid odours inside.
- **With the appliance switched off, perform the inspections set forth in section 6.2.1.1-6.2.1.6.**

6.2.2.2 Monthly maintenance

- During maintenance work we comply with the principles set forth in section **6.1 General safety measures**.
- During monthly maintenance carry out the activities set forth in sections **6.2.1 Inspections** and **6.2.2.1 Daily maintenance**.

7. Work prohibited on the appliance

- It is prohibited to use the appliance for other than intended purposes!
- It is prohibited to interfere with the electrical connections of the appliance!
- It is prohibited to perform the prohibited work specified in other sections of these Instructions for Use!
- It is prohibited to wash the appliance with pressure water!
- It is prohibited to treat the appliance roughly!
- It is prohibited to operate the appliance without prior training and without these Instructions for Use!

8. Table of possible malfunctions and their correcting

Designation of defect	Message on the control unit	Possible method of removal
Tub does not heat - defective water tub heating probe	PF1	Replace the probe
Tub overheats - defective relay of the electronic unit	HiA	Replace the control unit
Tub does not heat, the heating indicator lamp on the electronic unit is on – defective heater	No message	Replace the heater
Tub does not heat, green and red indicator lamps are on – defective heater	No message	Replace the heater
Tub does not heat, only the green indicator lamp is on – defective mechanical thermostat	No message	Replace the thermostat
Tub overheats, green and red indicator lamps are on – defective mechanical thermostat	No message	Replace the thermostat

9. Inquiries

If you need help and advice, do not hesitate to contact us, and we will assist you with everything. You can find our contact information on our website www.gastro.cz.

Annex 1.1

Heating tubs – Wiring diagram of the Mechanical thermostat

Legend:

- S - main switch
- K1 - supply voltage indicator lamp – green
- T - thermostat 30-90°C
- K2 - heating indicator lamp – red
- TT - heater 660 W/230 V

- Bain-marie 1GN - 1 x 660 W
- Bain-marie 2GN - 3 x 660 W
- Bain-marie 3GN - 4 x 660 W
- Bain-marie 4GN - 5 x 660 W

Annex 1.2

Heating tubs – Wiring diagram of the el. unit DIXELL

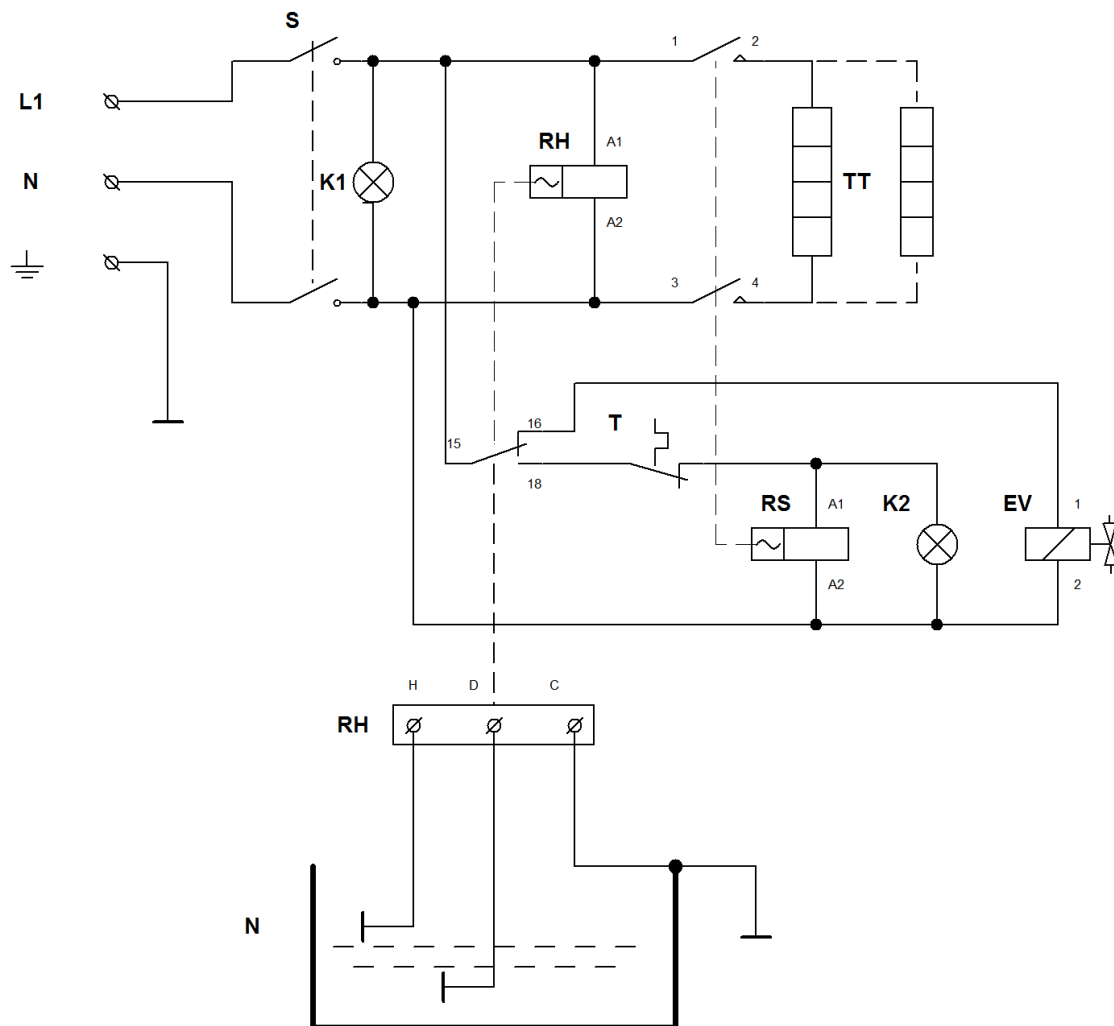

Legend:

- S1 - main switch
- EJ1 - electronic control unit
- SEP - water bath temperature sensor
- TT - heater 660 W/230 V

- Bain-marie 1GN - 1 x 660 W
- Bain-marie 2GN - 3 x 660 W
- Bain-marie 3GN - 4 x 660 W
- Bain-marie 4GN - 5 x 660 W

Annex 1.3

Heating tubs – Wiring diagram of the Mechanical thermostat + Automatic level monitoring and water refill

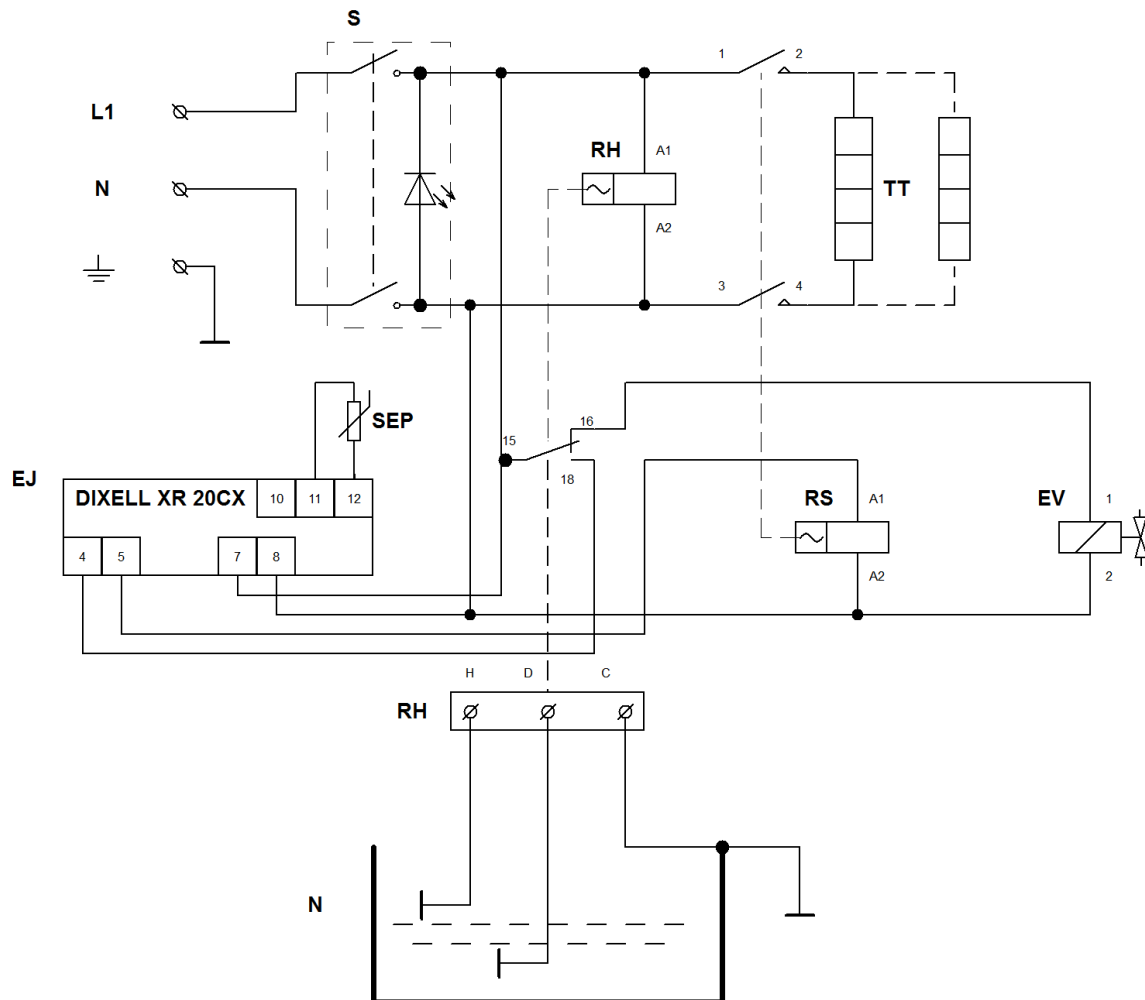

Legend:

S	-	main switch
K1	-	supply voltage indicator lamp – green
T	-	thermostat 30-90°C
K2	-	heating indicator lamp – red
TT	-	heater 660 W/230 V
RH	-	surface relay HRH5
RS	-	power relay
EV	-	water refill solenoid valve
N	-	heated water bath

Bain-marie 1GN	-	1 x 660 W
Bain-marie 2GN	-	3 x 660 W
Bain-marie 3GN	-	4 x 660 W
Bain-marie 4GN	-	5 x 660 W

Annex 1.4

Heating tubs – Wiring diagram of the El. unit + Automatic level monitoring and water refill

S	-	main switch
EJ	-	el. unit
SEP	-	temperature sensor
TT	-	Heater 660W/230V
RH	-	surface relay HRH5
RS	-	power relay
EV	-	water refill solenoid valve
N	-	heated water bath

Bainmarie 1GN	-	1 x 660W
Bainmarie 2GN	-	3 x 660W
Bainmarie 3GN	-	4 x 660W
Bainmarie 4GN	-	5 x 660W

Annex 1.4

Heating tubs – Technical drawing

Legend:

1. Frame (drop-in)
2. Partitions
3. Pressed tub
4. Isolation
5. Heater
6. Tub cover
7. Fill sensor
8. Bottom plate with partition (thermostat, pilot lights, valve, drain,...)
9. Flex cable

Annex 2.1

Dry heated tub – Wiring diagram

We are updating the wiring diagram to provide more detailed information. For any questions, please contact us.

Annex 2.2

Dry heated tub – Technical drawing

Legend:

1. Frame (drop-in)
2. Mounting fixtures for tub
3. Tub assembly (pressed tub, tub cover...)
4. Glass-ceramic plate with heaters
5. Control knob with pilot lights
